

- ✓ **Galileo Exploration Ltd.** (the “Company”) recently acquired an option to purchase 100% of the **Signal Property** consists of 79 lode mining claims on the west edge of the Eureka District, Nevada.
- ✓ The Property lies adjacent the Ruby Hill Mine, formerly operated by Barrick Gold. The Signal Property hosts outcropping Carlin type gold mineralization of several distinct styles. Seven previous operators have completed approximately 50,000 feet of drilling.
- ✓ The **Signal Property** consists of 79 lode mining claims on the west edge of the Eureka District, Nevada, and enjoys excellent access and logistics, with no identified environmental or operational problems.
- ✓ Exposures on the Property are marked by a section of Silurian through Mississippian sediments that includes several regionally proven host rocks, and is cut by at least three petrologically distinct intrusive suites.
- ✓ The structural setting is somewhat complex, with compressive faulting, including the Roberts Mtn thrust, overprinted by high and low-angle extensional faults. The Property lies atop a large gold cell, within a local, 12km zone of gold mineralization, athwart the regional Battle Mtn-Eureka Trend.
- ✓ Has identified three separate zones of gold mineralization, each more than 2km apart. Each zone is open to expansion, and the best explored-the Signal Zone- hosts an in-house calculated mineral inventory of about 35,000 oz. Au at leach grades.
- ✓ Gold mineralization includes “classic” dissemination and jasperoid at the Devonian-Mississippian contact; pods and lenses within both high and low angle structures; and poorly understood, “Long Canyon” style solution/collapse breccias. Some gold has been found in property-scale stratigraphies not described elsewhere.
- ✓ While any of these mineralization styles could host significant orebodies, it appears the recently discovered breccia bodies may host the best potential ore grades. In the West and Bisoni zones, some ground appears concealed by young gravity slides, and rigorous geologic methods may reveal mineralization.

- ✓ Exploration to date includes mapping, rock and soil geochemistry, some trenching, and both RC and core drilling, conducted since the 1980's by a number of qualified firms.
- ✓ All work to date has been relatively shallow. A robust data base is available, and drill targets could be modeled inexpensively by detailed geologic work. Synergies with the adjacent Ruby Hill Mine/Leach facility, now owned by a subsidiary of Waterton Global, suggests a production threshold may be more easily achieved.

Signal property

[Project Overview](#)
[Technical Reports](#)
[Back to Projects](#)

The Signal property is located along Nevada's Battle Mountain/Eureka Gold trend, in the northwest portion of the Eureka District. Within the district are several active exploration projects and Barrick's Ruby Hill gold mine, located six kilometres to the east of Signal.
